# Project background & business need/opportunity

---

The University of Regina community, including students and faculty, faces challenges with their daily commutes, such as dependence on time-consuming public transportation, unreliability due to weather conditions, and long waiting times during Saskatchewan winters. To address these concerns, we propose the development of a web-based application that facilitates carpooling and ride-sharing among the university community. This not only lessens the carbon footprint but also allows the car owner to earn a small amount.

# Status description

---

- Status : Green
  - Work on PWA
  - Ride/drive history
  - Implementing Payment system
  - Integrating the changes based on user feedback from previous Bazaar Day

## Project issues

---

- Time taking design.

## Project changes

---

- As of now we still plan to continue our project as intended.
- Will meet up with Tim and Kin to get further assistance in escalating the progress.

# Tech stack

---

- React
- Node
- Mongo
- Jsx
- Bootstrap CSS
- HTML
- JS
- Node server on AWS ec2 Instance
